

Project Management and Efficiency Solutions

BaselineES provides full engineering and project management services to help our clients achieve their energy efficiency goals.

BaselineES offers “virtual turnkey” energy efficiency project management, starting with the identification of projects that offer the most attractive returns on investment. We design, develop, and manage the implementation of energy and maintenance retrofit and upgrades projects and programs to help our clients :

REDUCE

- Energy Consumption & Costs
- Operational Inefficiencies
- Equipment Wear & Tear
- Environmental Impact

IMPROVE

- System Performance
- Equipment Reliability
- Equipment Longevity
- Sustainability

Additionally, BaselineES acts strictly as the owner’s agent, and does not sell any equipment or act as an installation contractor, so there is never any doubt as to whose interests we are serving.

BaselineES specializes in large-scale multi-site projects, including HVAC optimization, refrigeration system upgrades, and VFD installations, to help our clients achieve substantial reductions in energy expense across their entire portfolio. Additionally, our monitoring and optimization services help to maintain improved facility conditions post-retrofit, and ensure our clients continue to benefit from their investment years down the road.

For purely supply-side energy and maintenance cost reduction projects, BaselineES can help customers negotiate the best possible rates and supply agreements for energy supply, facilities maintenance, or any related services. We know where the best supply and demand side opportunities are and how to bring them to fruition.

With BaselineES, you can count on data-driven solutions, and significant and sustainable long-term results.

ACHIEVE MORE WITH LESS
